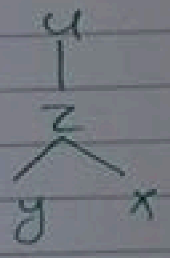
L.H.S = R.H.S

if $u = \tan^{-1}\left(\frac{x^3+y^3}{x-y}\right)$ prove $x\frac{\partial u}{\partial x} + y\frac{\partial u}{\partial y} = \sin 2u$

Solution

Put $z = \frac{x^3+y^3}{x-y}$ $\quad u = \tan^{-1} z$

$z = \tan u$



∴ z is an H fn of order 2

$\rightarrow x z_x + y z_y = 2z \rightarrow$ ①

$\rightarrow$ L.H.S $= x u_x + y u_y =$

$$= x\frac{\partial u}{\partial z}\frac{\partial z}{\partial x} + y\frac{\partial u}{\partial z}\frac{\partial z}{\partial y} = \frac{\partial u}{\partial z}\left(x\frac{\partial z}{\partial x} + y\frac{\partial z}{\partial y}\right)$$

∴ LHS $= u_z(x z_x + y z_y)$ → from ①

∴ L.H.S $= u_z * 2z = \left(\frac{1}{1+z^2}\right) * 2z = \frac{1}{1+\tan^2 u} * 2\tan u$

∴ L.H.S $= \frac{1}{\sec^2 u} * 2\tan u = \cos^2 u * 2\frac{\sin u}{\cos u} = 2\sin u\cos u$

∴ L.H.S $= \sin 2u$ = R.H.S.
